

Numerical Methods for the Solution of PDEs

Laboratory with deal.II — www.dealii.org

A Poisson solver - deal.II step-3/step-4

Luca Heltai <luca.heltai@unipi.it>

Aims for this Lecture

- First introduction into assembly of sparse linear systems
 - Translation of weak form to assembly loops
 - Applying boundary conditions
- Using linear solvers
- Post-processing and visualisation

Reference material

- Tutorials
 - Step-3

Recap of Poisson Problem

Variational, continuous problem, infinite dimensional space:

$$\int_{\Omega} \nabla u \cdot \nabla v = \int_{\Omega} f v \quad \forall v \in H_0^1(\Omega)$$

Variational, discrete problem, finite dimensional space:

$$\int_{\Omega} \nabla u_h \cdot \nabla v_h = \int_{\Omega} f v_h \quad \forall v_h \in V_h \subset H_0^1(\Omega)$$

Recap of Poisson Problem

$$\int_{\Omega} \nabla u_h \cdot \nabla v_h = \int_{\Omega} f v_h \quad \forall v_h \in V_h = \text{span}\{v_i\}_{i=1}^N$$

$$\iff$$

$$A_{ij} u^j = F_i \quad u_h := u^i v_i$$

$$A_{ij} := \int_{\Omega} \nabla v_j \nabla v_i \quad F_i := \int_{\Omega} f v_i$$

Split Assembly on cells

$$A_{ij} := \int_{\Omega} \nabla v_j \cdot \nabla v_i d\Omega \quad F_i := \int_{\Omega} f v_i d\Omega$$

$$A_{ij} = \sum_m \int_{T_m} \nabla v_j \cdot \nabla v_i dT_m$$

To make this efficiently, we need a smart way to map
local dofs to global dofs

Split Assembly on cells

$$A_{ij} = \sum_m \int_{T_m} \nabla v_j \cdot \nabla v_i dT_m = \sum_m \int_{\hat{T}} [(\nabla v_j) \circ F_m] \cdot [(\nabla v_i) \circ F_m] J_m d\hat{T}$$

$$v_i \circ F_m|_{T_m} = \sum_{\alpha} P_{mi\alpha} \hat{v}_{\alpha}$$

$$P_{mi\alpha} = \begin{cases} 1 & \text{if local dof } \alpha \text{ on element } T_m \text{ maps to global dof } i \\ 0 & \text{otherwise} \end{cases}$$

Split Assembly on cells

$$A_{ij} = \sum_m \int_{T_m} \nabla v_j \cdot \nabla v_i dT_m = \sum_m \int_{\hat{T}} [(\nabla v_j) \circ F_m] \cdot [(\nabla v_i) \circ F_m] J_m d\hat{T}$$

$$A_{ij} = \sum_m \sum_{\alpha} \sum_{\beta} P_{mi\alpha} \int_{\hat{T}} [(DF_m^{-T} \hat{\nabla} \hat{v}_{\alpha})] \cdot [DF_m^{-T}(\hat{\nabla} \hat{v}_{\beta})] J_m d\hat{T} P_{mj\beta}$$

$$A_{ij} = \sum_m \sum_{\alpha} \sum_{\beta} \sum_q P_{mi\alpha} [(DF_m^{-T} \hat{\nabla} \hat{v}_{\alpha})](\hat{x}_q) \cdot [DF_m^{-T}(\hat{\nabla} \hat{v}_{\beta})](\hat{x}_q) J_m(\hat{x}_q) w_q P_{mj\beta}$$

$$m \in [0, N_{\text{cell}}) \quad \alpha, \beta \in [0, N_{\text{localdofs}}) \quad i, j \in [0, N_{\text{dofs}}) \quad q \in [0, N_{\text{qpoints}})$$

Local VS global matrix

$$A_{ij} = \sum_m \int_{T_m} \nabla v_j \cdot \nabla v_i dT_m = \sum_m \int_{\hat{T}} [(\nabla v_j) \circ F_m] \cdot [(\nabla v_i) \circ F_m] J_m d\hat{T}$$

$$A_{ij} = \sum_m \sum_{\alpha} \sum_{\beta} \sum_q P_{mi\alpha} [(DF_m^{-T} \hat{\nabla} \hat{v}_{\alpha})](\hat{x}_q) \cdot [DF_m^{-T}(\hat{\nabla} \hat{v}_{\beta})](\hat{x}_q) J_m(\hat{x}_q) w_q P_{mj\beta}$$

$$a_{m\alpha\beta} := \sum_q [(DF_m^{-T} \hat{\nabla} \hat{v}_{\alpha})](\hat{x}_q) \cdot [DF_m^{-T}(\hat{\nabla} \hat{v}_{\beta})](\hat{x}_q) J_m(\hat{x}_q) w_q$$

$$A = \sum_m P_m^T a_m P_m$$

Local VS global right-hand-side

$$F_i = \sum_m \int_{T_m} f v_i dT_m = \sum_m \int_{\hat{T}} [f \circ F_m] [v_i \circ F_m] J_m d\hat{T}$$

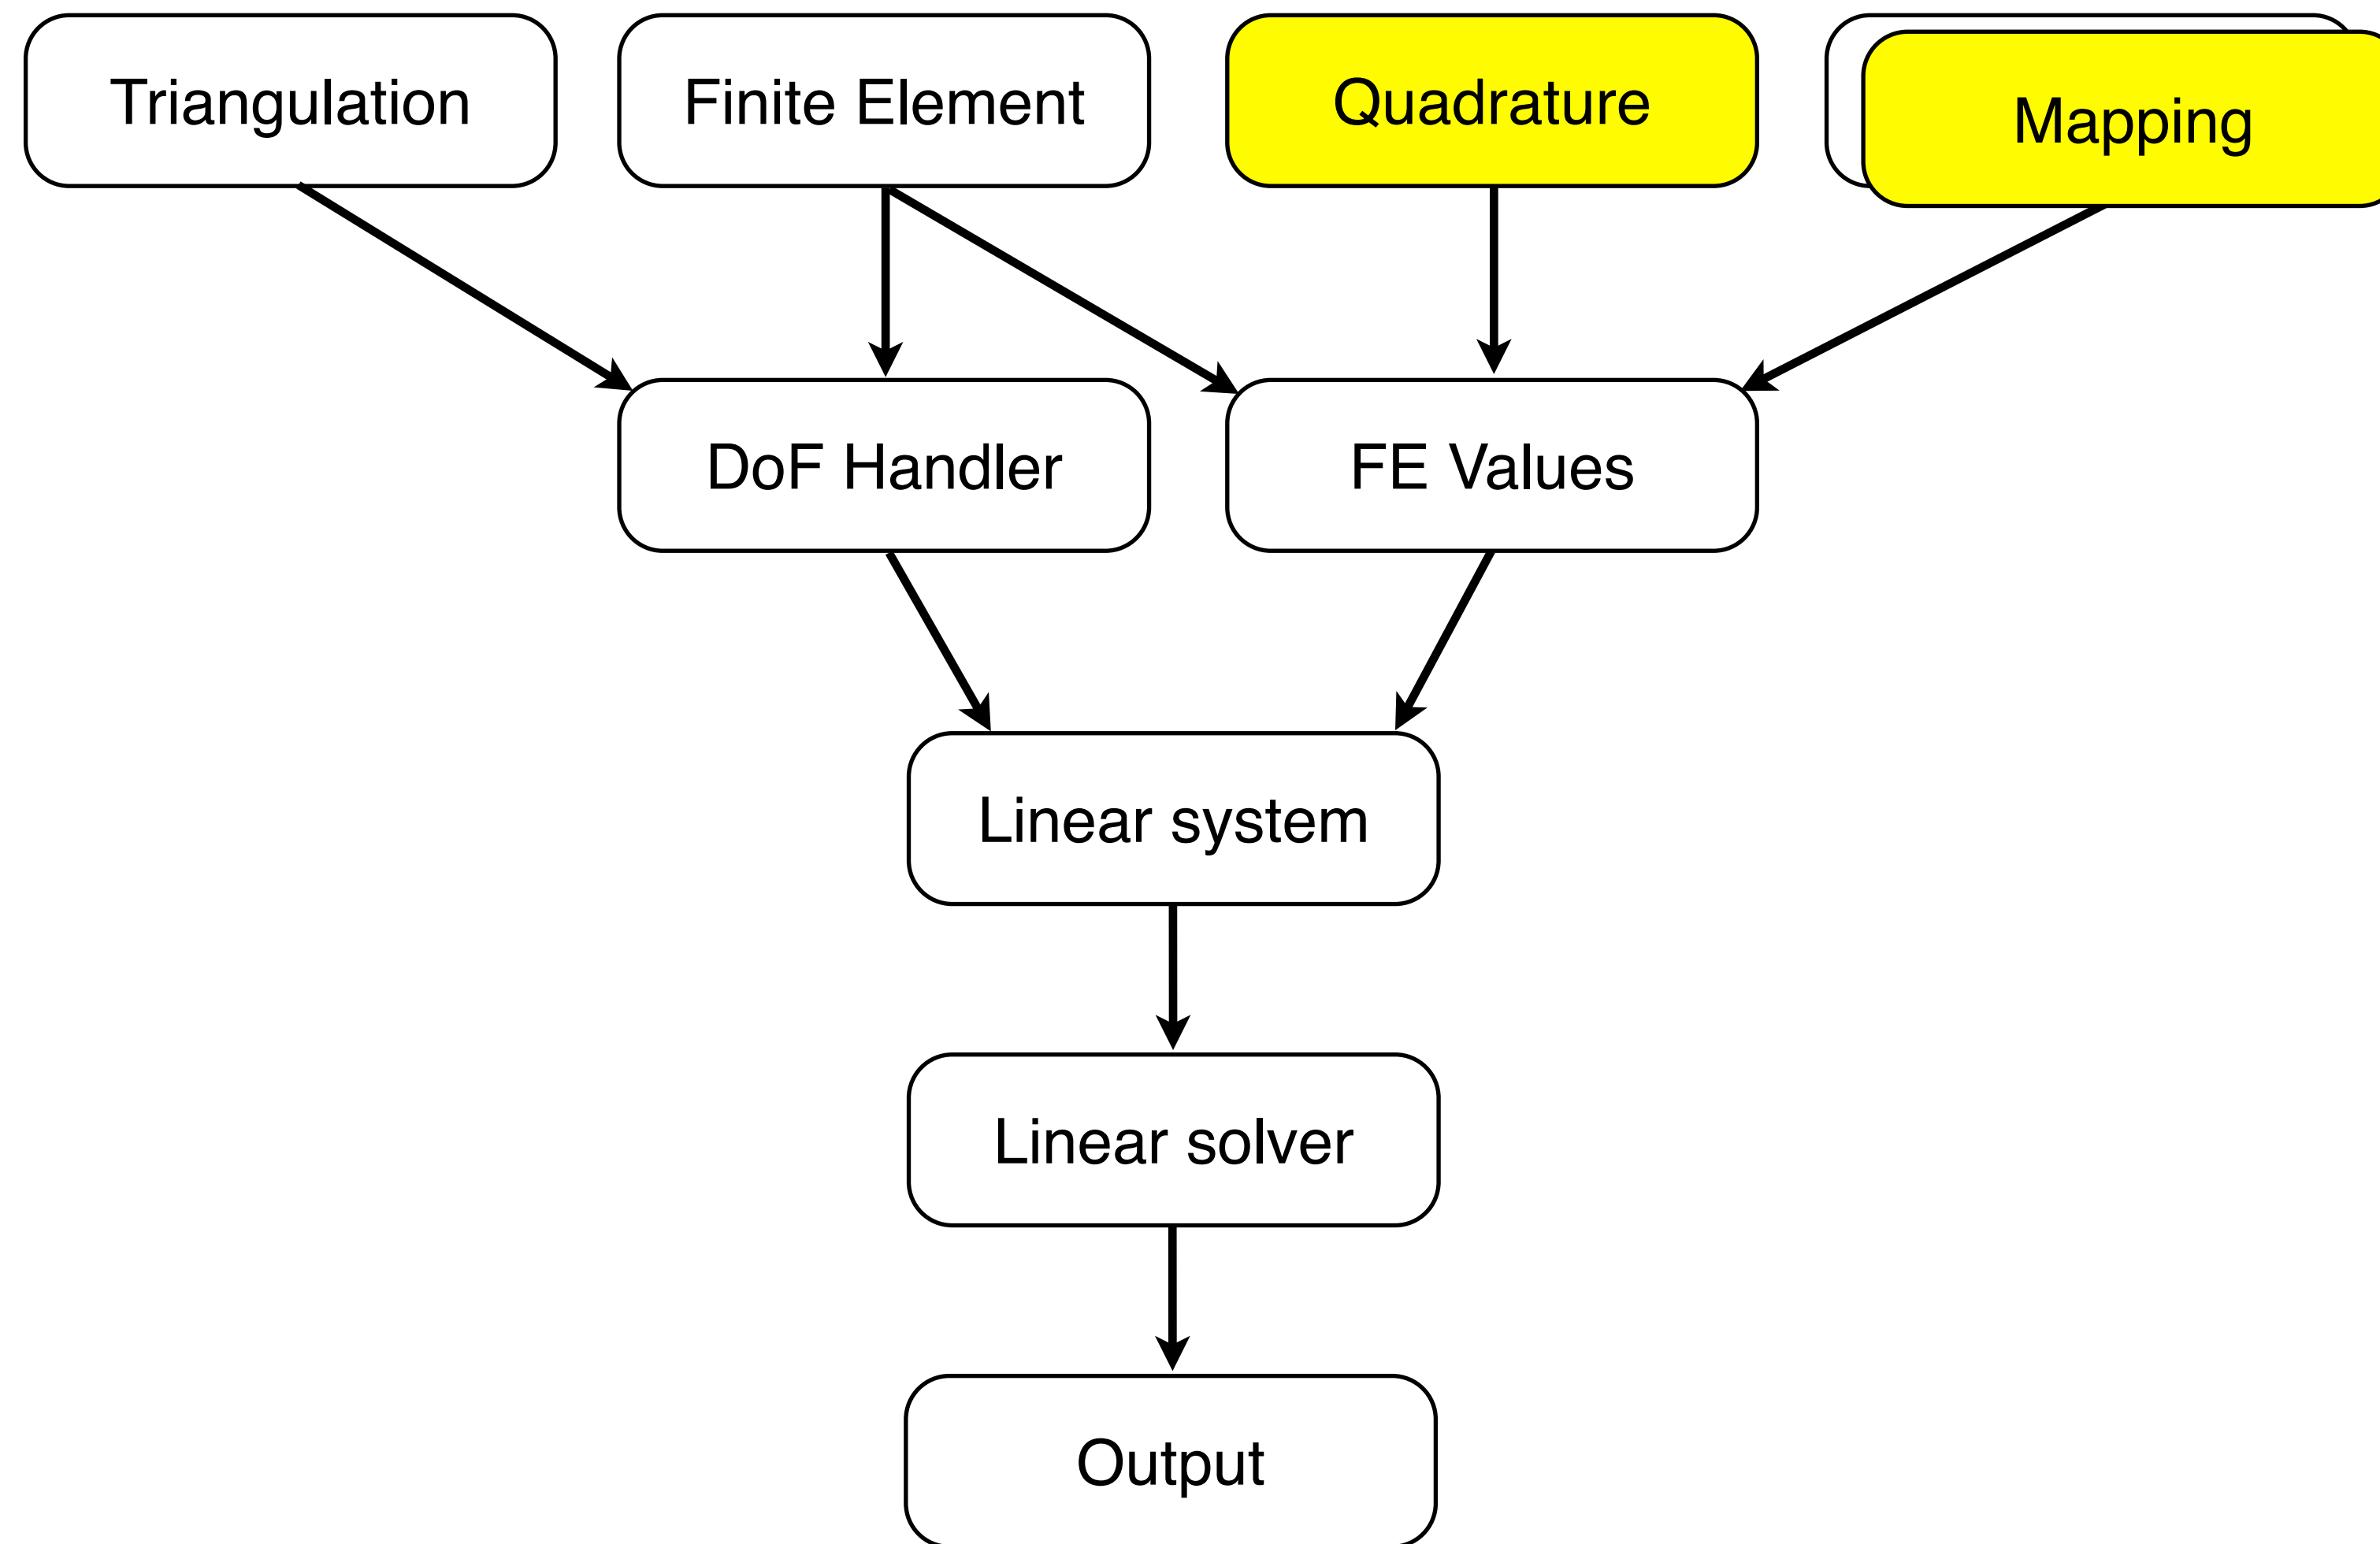

$$F_i = \sum_m \sum_{\alpha} \sum_q P_{mi\alpha} [f \circ F_m](\hat{x}_q) \hat{v}_{\alpha}(\hat{x}_q) J_m(\hat{x}_q) w_q$$

$$f_{m\alpha} := \sum_{\alpha} \sum_q [f \circ F_m](\hat{x}_q) \hat{v}_{\alpha}(\hat{x}_q) J_m(\hat{x}_q) w_q$$

$$F = \sum_m P_m^T f_m$$

Structure of a prototypical FE problem

Integration on a cell: the Quadrature classes

- n-Order Gauss quadrature
- Other rules
 - Gauss Lobatto
 - Simpson
 - Trapezoidal
 - Midpoint
 - A few others
- Anisotropic
 - Tensor product

FE_Q<2>(1)

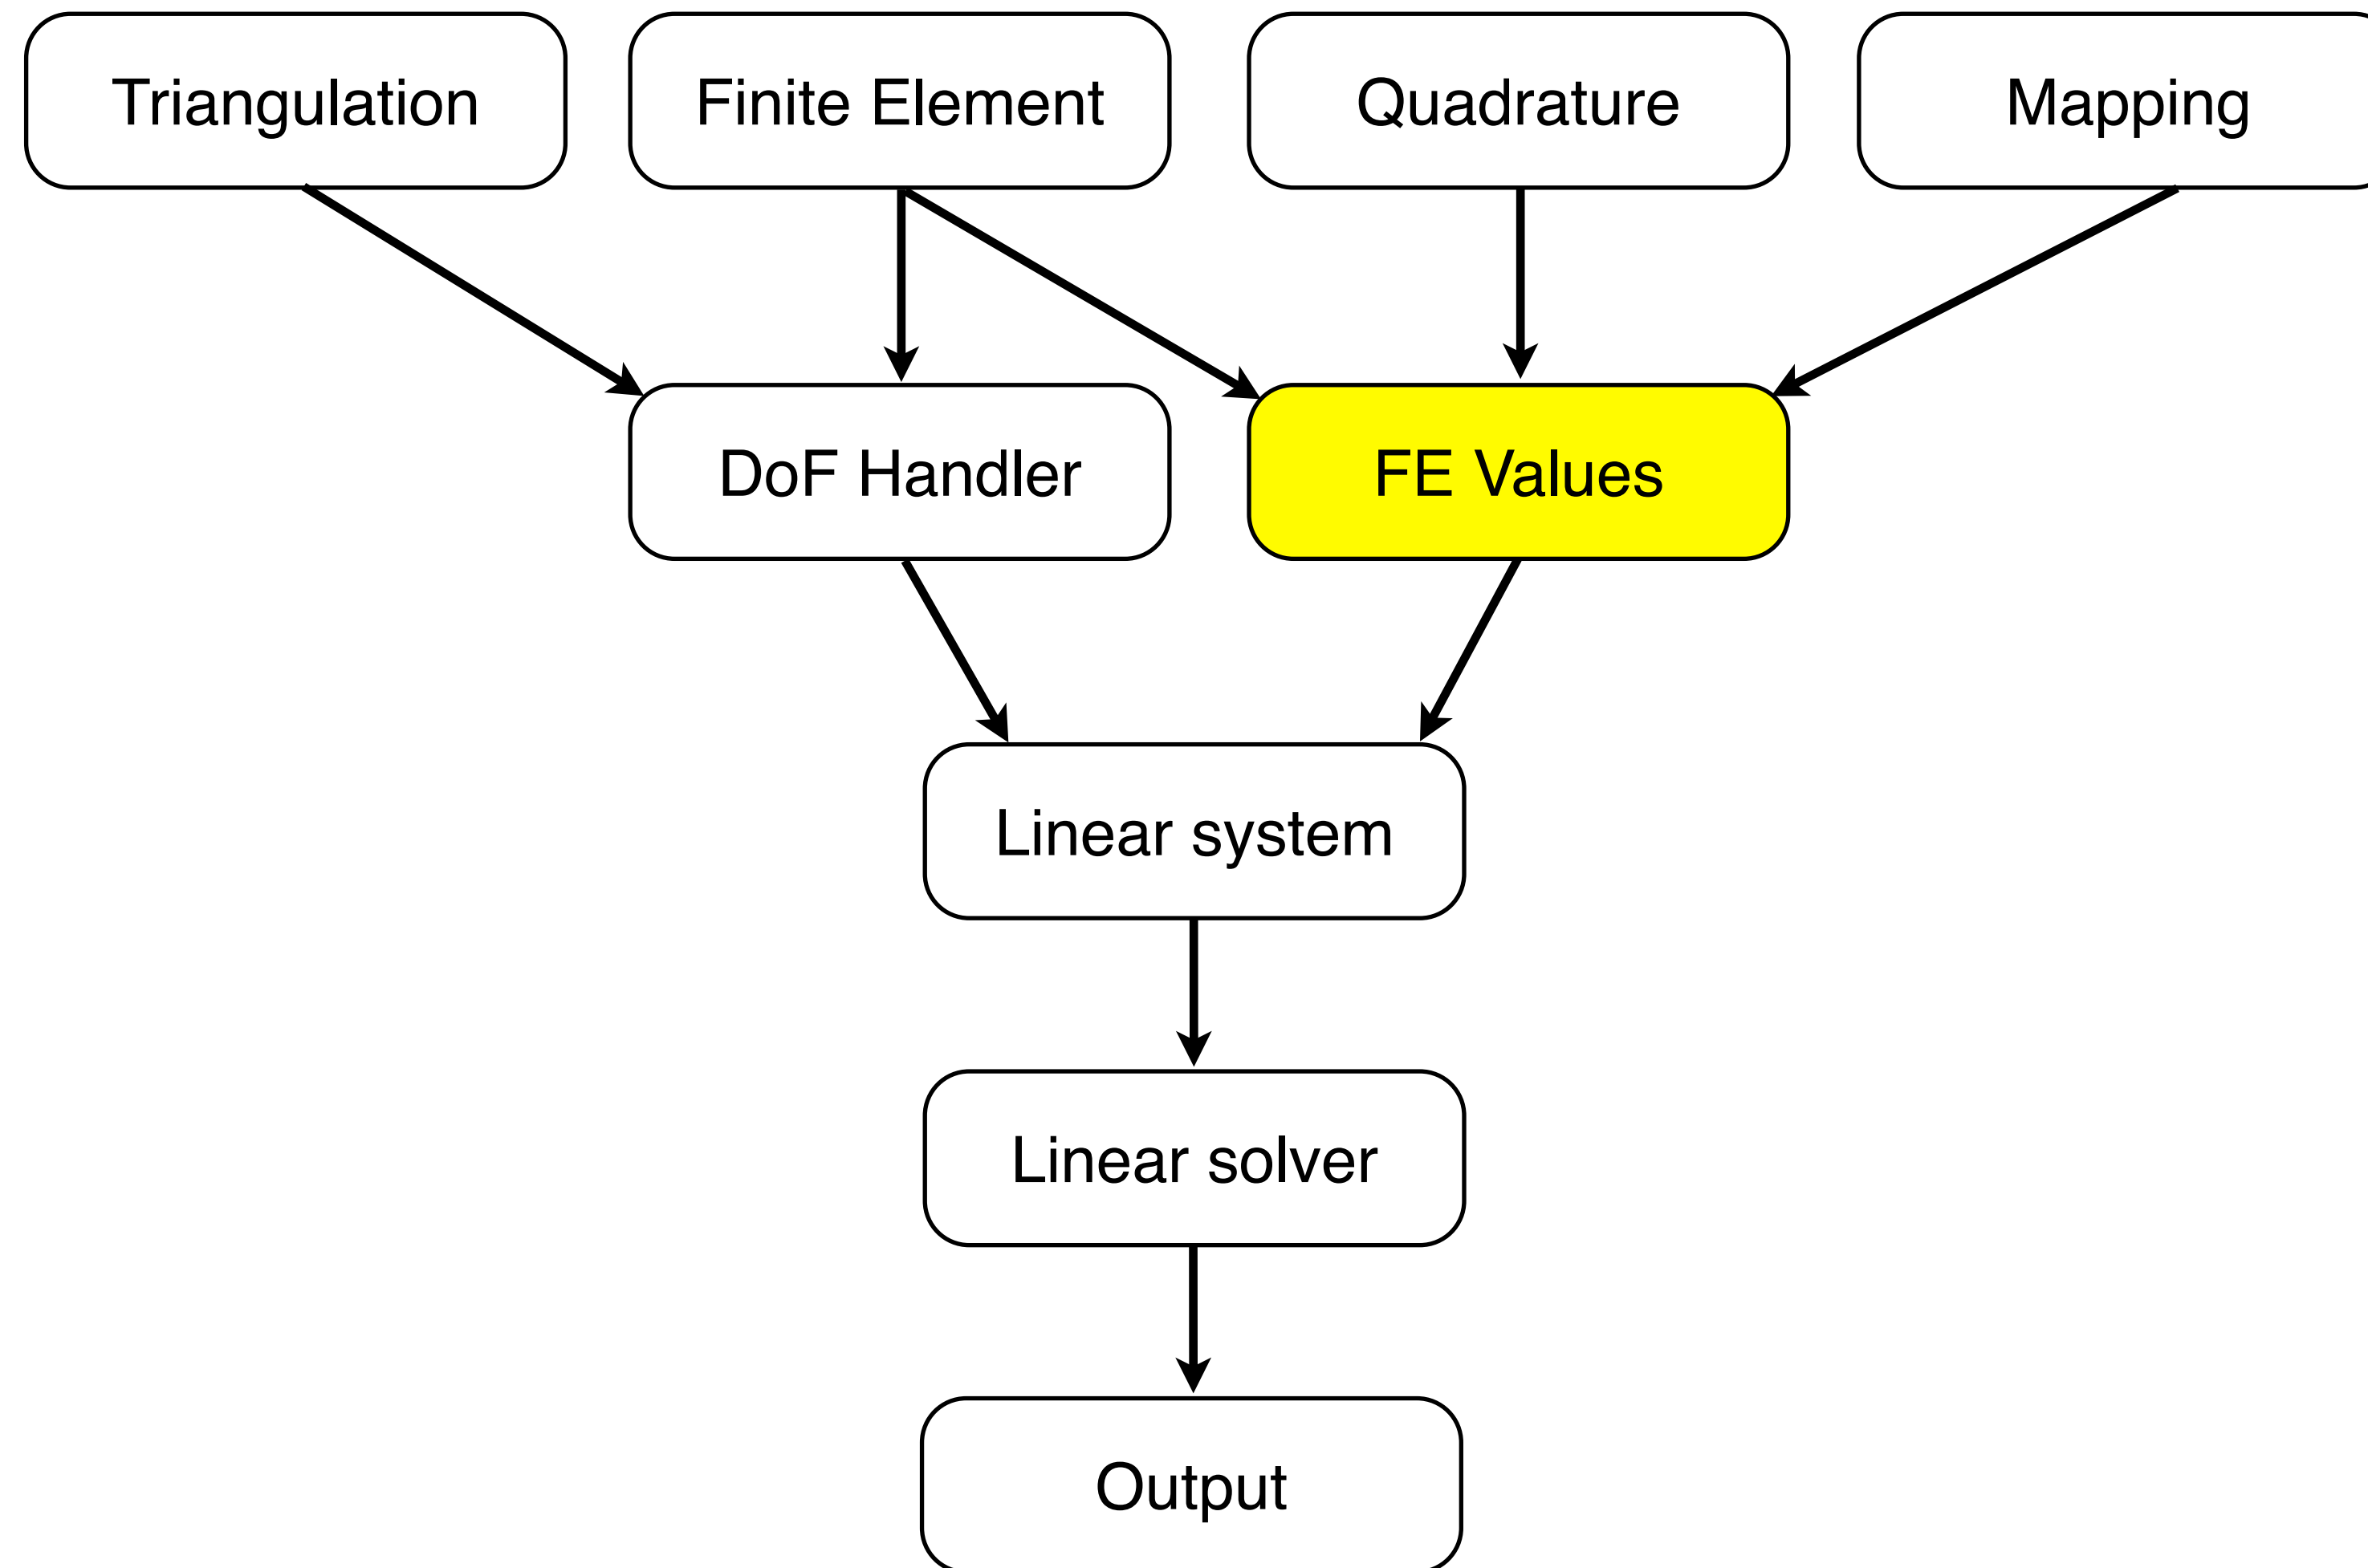

Integration on a cell: the Mapping classes

- n-order mappings
 - Increase accuracy of:
 - Integration schemes
 - Surface basis vectors
- Lagrangian / Eulerian
 - Latter useful for fluid and contact problems, d
- Boundary and interior manifolds

Structure of a prototypical FE problem

Integration on a cell: the FEValues class

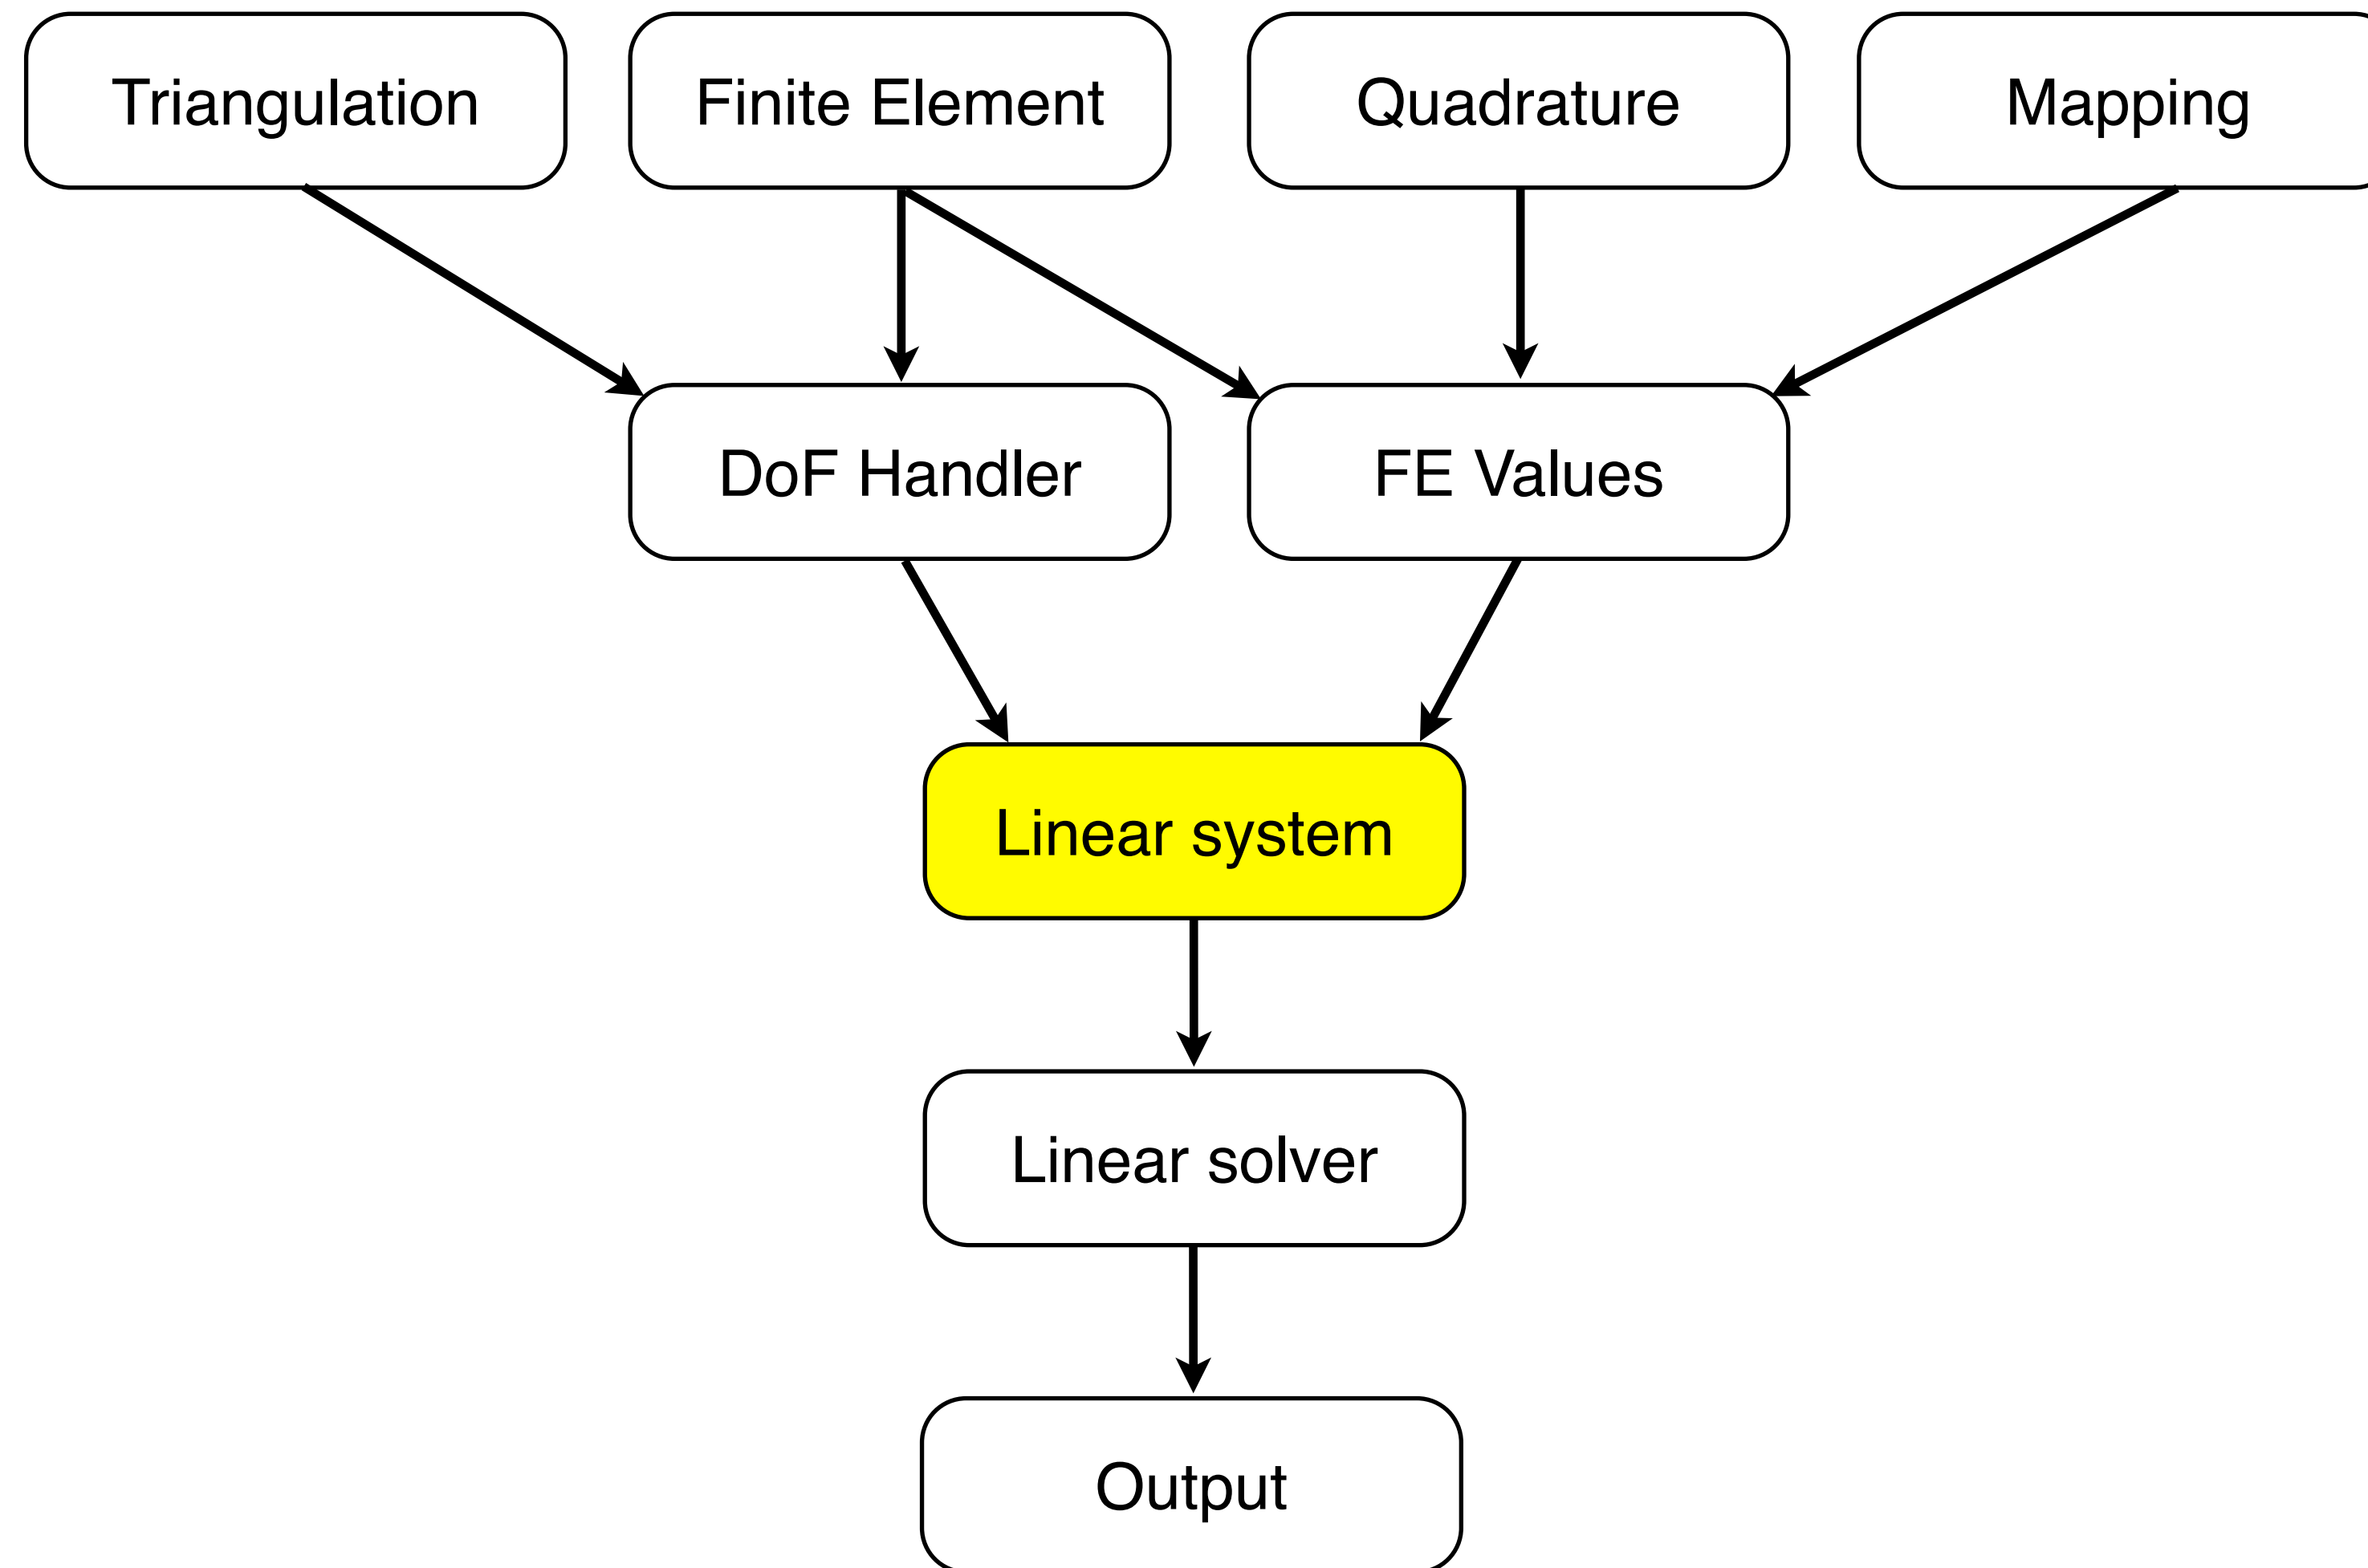

- Object that helps perform integration
- Combines information of:
 - Cell geometry
 - Finite-element system
 - Quadrature rule
 - Mappings
- Can provide:
 - Shape function data
 - Quadrature weights and mapping jacobian at a point
 - Normal on face surface
 - Covariant/contravariant basis vectors
- More ways it can help:
 - Object to extract shape function data for individual fields
 - Natural expressions when coding
- Low level optimisations

$$a_{IJ} := \sum_q [(DF_m^{-T} \hat{\mathbf{V}} \hat{\mathbf{v}}_I)](\hat{\mathbf{x}}_q) \cdot [DF_m^{-T}(\hat{\mathbf{V}} \hat{\mathbf{v}}_J)](\hat{\mathbf{x}}_q) J_m(\hat{\mathbf{x}}_q) w_q$$

```
cell_matrix(I,J) +=  
  
    * fe_values.shape_grad (I, q_point)  
  
    * fe_values.shape_grad (J, q_point)  
  
    * fe_values.JxW (q_point);
```

Structure of a prototypical FE problem

Sparse linear systems

- Minimise data storage
 - Evaluate grid connectivity
- Functions to help set up
 - Connectivity
 - Constraints
- Minimal access times
 - Direct manipulation of (non-zero) entries
 - Matrix-vector operations
 - Skip over zero-entries
- Types
 - Unity (monolithic, contiguous)
 - Block sparse structures
- Sub-organisation (e.g. component-wise)

$$[K] \{d\} = \{F\}$$

$$\begin{bmatrix} K_{11} & K_{12} \\ K_{21} & K_{22} \end{bmatrix} \begin{Bmatrix} d_1 \\ d_2 \end{Bmatrix} = \begin{Bmatrix} F_1 \\ F_2 \end{Bmatrix}$$

- $(K_{11} - K_{12}K_{22}^{-1}K_{21}) d_1 = F_1 - K_{12}K_{22}^{-1}F_2$
- $d_2 = K_{22}^{-1} (F_2 - K_{21}d_1)$

Solving Poisson's equation

- Demonstration: Step-3
https://www.dealii.org/current/doxygen/deal.II/step_3.html
<http://www.math.colostate.edu/~bangerth/videos.676.10.html>
- Key points
 - Local assembly + quadrature rules
 - Distribution of local contributions to the global linear system
 - Application of boundary conditions
 - Solving a linear system
 - Output for visualisation
